Swaption As a Missing Link in Asset Allocation

Swaption As a Missing Link in Asset Allocation

Global Financial Crisis

High inflation period

A swaption is a financial derivative that can be described as an option to exchange a fixed rate bond for floating rate bonds for a predetermined principal. There are two types of swaptions, payer swaptions and receiver swaptions. A payer swaption gives the holder the right to pay a fixed interest rate and receive a floating rate, similar to a call option in the stock market. On the other hand, a receiver swaption allows the holder to pay a floating interest rate and receive a fixed rate, resembling a put option.
